## Simple Harmonic Motion

# 3.1 Simple Harmonic Motion

Force on the pendulum

$$F_\theta = -m g \sin \theta$$

Equation of motion (EoM)

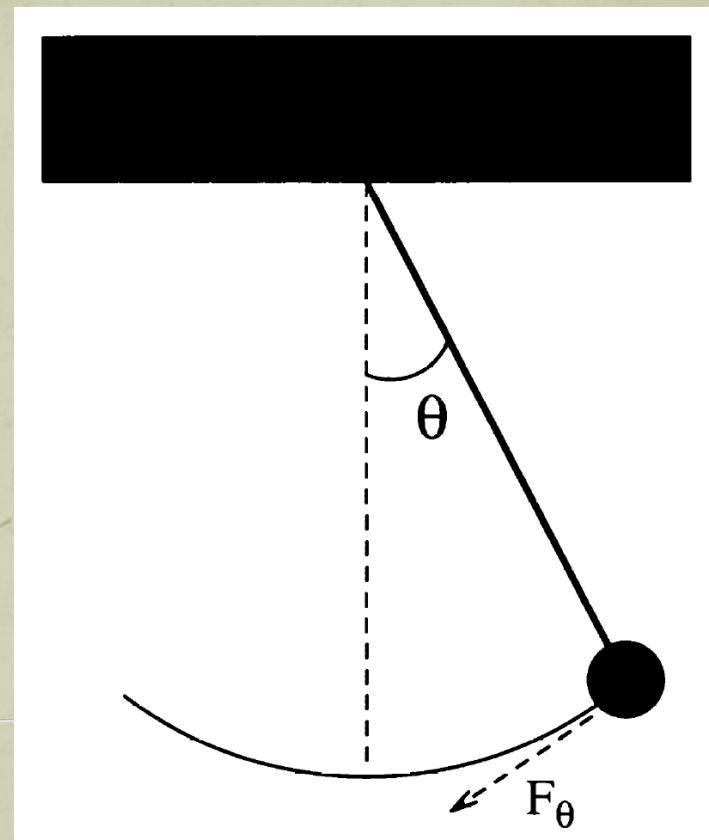

$$\frac{d^2\theta}{dt^2} = -\frac{g}{\ell} \theta \quad \sin \theta \approx \theta$$

Analytical solution:

$$\theta = \theta_0 \sin(\Omega t + \phi)$$

$$\Omega = \sqrt{g/\ell}, \text{ and } \theta_0 \text{ and } \phi \text{ are}$$

constants determined by initial conditions.

The period of the SHO is given by  $T = 2\pi \sqrt{\frac{\ell}{g}}$

# Euler method to solve the EoM

$$\frac{d^2\theta}{dt^2} = - \frac{g}{\ell} \theta$$

$$\frac{d\omega}{dt} = - \frac{g}{\ell} \theta ,$$

$$\frac{d\theta}{dt} = \omega ,$$

Run t for a few period ( $T$ )  
to see the oscillatory  
behavior

Set  $\Delta t$ ,  $\theta_0$ ,  $\omega_0$ ,  $l$ ,  $g$ , iterate

$$\omega_{i+1} = \omega_i - \frac{g}{\ell} \theta_i \Delta t ,$$

$$\theta_{i+1} = \theta_i + \omega_i \Delta t .$$

$$t_{i+1} = t_i + \Delta t$$

sample code 3.1.1

# Total energy of SHO

The total energy of the SHO in can be calculated as

$$\begin{aligned}E_{i+1} &= K_{i+1} + U_{i+1} = \frac{1}{2}m(l\omega_{i+1})^2 + mgl(1 - \cos\theta_{i+1}) \\&\approx \frac{1}{2}ml^2\omega_{i+1}^2 + mgl\left[1 - \left(1 - \frac{\theta_{i+1}^2}{2}\right)\right] \\&= \frac{1}{2}ml^2\omega_{i+1}^2 + \frac{1}{2}mgl\theta_{i+1}^2\end{aligned}$$

- You may use the Mathematica command `Series[Cos[x],{x,0,2}]` to obtain the Taylor series expansion of  $\cos\theta$  at  $\theta = 0$ . This is amount to making the assumption that  $\theta \rightarrow 0$ .

# Euler method fails in this case

- The oscillation amplitude increases with time → Euler method is not suitable for oscillatory motion (but may be good for projectile motion which is non-periodic)
- The peculiar effect of the numerical solution can also be investigated from the energy of the oscillator when Euler method is applied:
  - $E \approx (1/2)m l^2 [\omega^2 + (g/l)\theta^2]$  (with  $\theta \rightarrow 0$ )
  - Discretise the equation by applying Euler method,
  - $E_{i+1} = E_i + (1/2)mg l^2 [\omega_i^2 + (g/l)\theta_i^2](\Delta t)^2$
  - →  $E$  increases with  $i \rightarrow$  this is an undesirable result.

# Euler vs. Euler-Cromer method

- In the Euler method:
- $\omega_{i+1}$  is calculated based on previous values  $\omega_i$  and  $\theta_i$
- So is  $\theta_{i+1}$  is calculated based on previous values  $\omega_i$  and  $\theta_i$

$$\omega_{i+1} = \omega_i - \frac{g}{\ell} \theta_i \Delta t ,$$

$$\theta_{i+1} = \theta_i + \omega_i \Delta t .$$

- In the Euler-Cromer method:
- $\omega_{i+1}$  is calculated based on previous values  $\omega_i$  and  $\theta_i$
- but  $\theta_{i+1}$  is calculated based on present values  $\omega_{i+1}$  and previous value  $\theta_i$

$$\omega_{i+1} = \omega_i - \frac{g}{\ell} \theta_i \Delta t ,$$

$$\theta_{i+1} = \theta_i + \omega_{i+1} \Delta t$$

sample code 3.2.2

# Euler vs Euler-Cromer

Euler method: forward differencing

$$\omega_i \approx \frac{\theta_{i+1} - \theta_i}{\Delta t} \Rightarrow \theta_{i+1} \approx \theta + \omega_i \Delta t_i$$

Euler-Cromer method: backward differencing

$$\omega_{i+1} \approx \frac{\theta_{i+1} - \theta_i}{\Delta t} \Rightarrow \theta_{i+1} \approx \theta + \omega_{i+1} \Delta t_i$$

# Why Euler-Cromer works better?

- Because it conserves energy over each complete period of motion.

## 3.2 Forced SHM

Drag force on a moving object,  $f_d = -kv$

For a pendulum, instantaneous velocity  $v = \omega l = l(d\theta/dt)$

Hence,  $f_d = -kl(d\theta/dt)$ .

The net force on the forced pendulum along the tangential direction

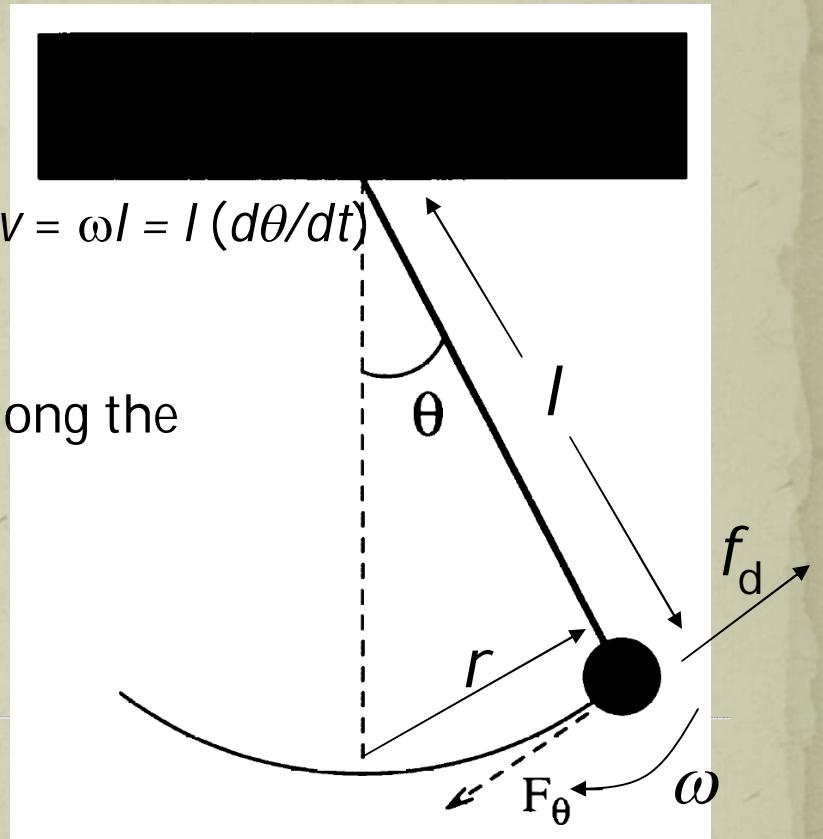

$$F_t = -m g \sin \theta - kl(d\theta/dt).$$

$$F = -mg \sin \theta - kl \frac{d\theta}{dt} \approx -mg\theta - kl \frac{d\theta}{dt};$$

$$m \frac{d^2 r}{dt^2} \approx m \frac{d^2}{dt^2}(l\theta) = ml \frac{d^2 \theta}{dt^2};$$

$$F = m \frac{d^2 r}{dt^2} \rightarrow \frac{d^2 \theta}{dt^2} = -\frac{g}{l}\theta - \frac{k}{m} \frac{d\theta}{dt} \equiv -\frac{g}{l}\theta - q \frac{d\theta}{dt}; q = \frac{k}{m}$$

E.o.M

# Analytical solution

Underdamped regime (small damping). Still oscillate, but amplitude decay slowly over many period before dying totally.

$$\theta(t) = \theta_0 e^{-qt/2} \sin\left(\varphi + t\sqrt{\Omega^2 - q^2/4}\right)$$

$\Omega = \sqrt{g/l}$  the natural frequency of the system

Overdamped regime (very large damping), decay slowly over several period before dying totally.  $\theta$  is dominated by exponential term.

$$\theta(t) = \theta_0 e^{-\left(qt/2 \pm \sqrt{q^2/4 - \Omega^2}\right)t}$$

Critically damped regime, intermediate between under- and overdamping case.

$$\theta(t) = (\theta_0 + Ct)e^{-qt/2}$$

# Cromer-Euler descretisation

$$\frac{d^2\theta}{dt^2} = -\frac{g}{l}\theta - q \frac{d\theta}{dt} \quad \text{Eq. (1)}$$

Let  $\omega = \frac{d\theta}{dt}$ . In term of  $\omega$ , Eq. (1) becomes

$$\frac{d\omega}{dt} = -\frac{g}{l}\theta - q\omega$$

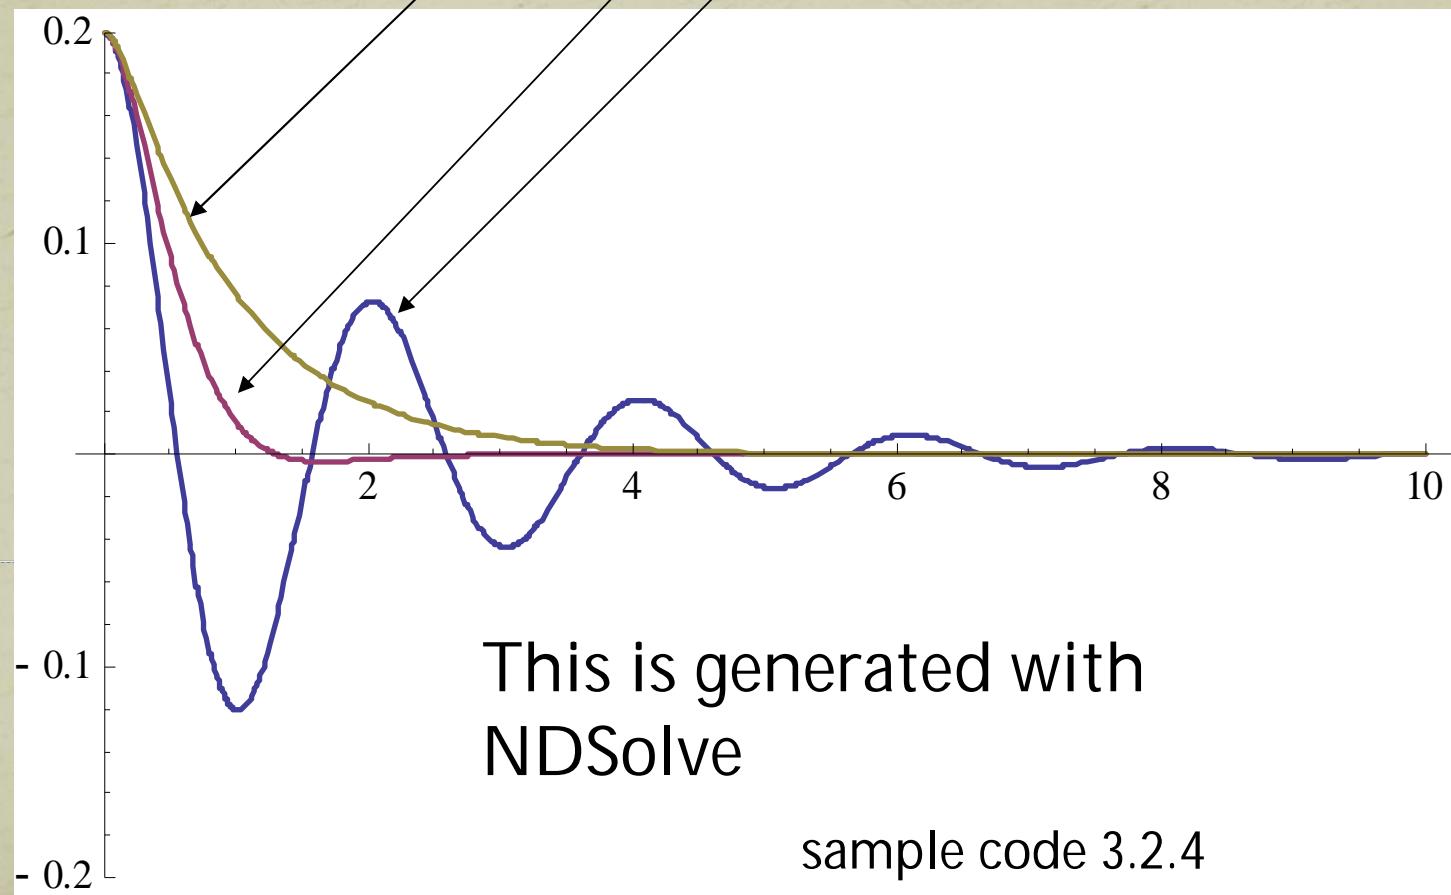

$$\rightarrow \frac{\omega_{i+1} - \omega_i}{\Delta t} = -\frac{g}{l}\theta_i - q\omega_i$$

---

$$\rightarrow \omega_{i+1} = \omega_i - \left( \frac{g}{l}\theta_i + q\omega_i \right) \Delta t$$

From  $\omega = \frac{d\theta}{dt} \rightarrow \theta_{i+1} = \theta_i + \omega_{i+1} \Delta t$  (Euler-Cromer) sample code 3.2.3

# Numerical solution of the damped oscillator for $\eta = 10, 5, 1$ , $L=1.0 \text{ m}$

# Adding driving force

$$F_\theta = -m g \sin \theta - kl(d\theta/dt) + F_D \sin(\Omega_D t)$$

$\Omega_D$  frequency of  
the applied force

$$F = -mg \sin \theta - kl \frac{d\theta}{dt} \approx -mg\theta - kl \frac{d\theta}{dt} + F_D \sin(\Omega_D t);$$

$$m \frac{d^2 r}{dt^2} \approx m \frac{d^2}{dt^2}(l\theta) = ml \frac{d^2 \theta}{dt^2};$$

$$F = m \frac{d^2 r}{dt^2} \rightarrow \frac{d^2 \theta}{dt^2} = -\frac{g}{l}\theta - \frac{k}{m} \frac{d\theta}{dt} + \frac{F_D}{m} \sin(\Omega_D t) \equiv -\frac{g}{l}\theta - q \frac{d\theta}{dt} + \frac{F_D}{m} \sin(\Omega_D t)$$

$$\frac{d^2 \theta}{dt^2} = -\frac{g}{l}\theta - q \frac{d\theta}{dt} + \frac{F_D}{m} \sin(\Omega_D t)$$

# Analytical solution

$$\theta(t) = \theta_0 \sin(\Omega_D t + \phi)$$

$$\theta_0 = \frac{F_D / m}{\sqrt{(\Omega^2 - \Omega_D^2)^2 + (q\Omega_D)^2}}$$

Resonance happens when  $\Omega_D = \Omega$

---

# Euler-Kromer descretisation

$$\frac{d^2\theta}{dt^2} = -\frac{g}{l}\theta - q\frac{d\theta}{dt} + \frac{F_D}{m}\sin(\Omega_D t)$$

$$\frac{d\omega}{dt} = -\frac{g}{l}\theta - q\omega + \frac{F_D}{m}\sin(\Omega_D t) \rightarrow \frac{\omega_{i+1} - \omega_i}{\Delta t} = -\frac{g}{l}\theta_i - q\omega_i + \frac{F_D}{m}\sin(\Omega_D t_i)$$

$$\rightarrow \omega_{i+1} = \omega_i - \left( \frac{g}{l}\theta_i + q\omega_i - \frac{F_D}{m}\sin(\Omega_D i\Delta t) \right) \Delta t$$

$$\text{From } \omega = \frac{d\theta}{dt} \rightarrow \theta_{i+1} = \theta_i + \omega_{i+1}\Delta t \quad (\text{Euler-Cromer})$$

sample code 3.2.5

# Second order Runge-Kutta method

- Consider a generic second order differential equation.

$$\frac{d^2y(t)}{dt^2} = f(y)$$

- It can be numerically solved using second order Runge-Kutta method.
- First, split the second order DE into two first order parts:

$$v(t) = \frac{dy(t)}{dt} \quad \frac{dv(t)}{dt} = f(y)$$

# Algorithm

- Set initial conditions:
- Calculate  $y' = y_i + \frac{1}{2} v_i \Delta t$
- Calculate  $v' = v_i + \frac{1}{2} f(y') \Delta t$
- Calculate  $y_{i+1} = y_i + v' \Delta t$
- Calculate  $v_{i+1} = v_i + f(y') \Delta t$

# RK2 for SHO

For the special case of SHO, the RK2 algorithm is translated into the following

$$\frac{d^2y(t)}{dt^2} = f(y)$$

$$v(t) = \frac{dy(t)}{dt},$$

$$\frac{dv(t)}{dt} = f(y)$$

Set initial conditions:  $y_0 \equiv t(0), v_0 \equiv v(0)$

Calculate  $y' = y_i + \frac{1}{2}v_i\Delta t$

Calculate  $v' = v_i + \frac{1}{2}f(y')\Delta t$

Calculate  $y_{i+1} = y_i + v'\Delta t$

Calculate  $v_{i+1} = v_i + f(y')\Delta t$

$$\equiv \frac{d^2\theta(t)}{dt^2} = -\left(\frac{g}{l}\right)\theta(t)$$

$$\equiv \omega(t) = \frac{d\theta(t)}{dt}$$

$$\equiv \frac{d\omega(t)}{dt} = -\left(\frac{g}{l}\right)\theta(t)$$

$$\theta_0 \equiv \theta(0), \omega_0 \equiv \omega(0)$$

$$\theta' = \theta_i + \frac{1}{2}\omega_i\Delta t$$

$$\omega' = \omega_i + \frac{1}{2}\left(-\frac{g}{l}\theta'\right)\Delta t$$

$$\theta_{i+1} = \theta_i + \omega'\Delta t$$

$$\omega_{i+1} = \omega_i + \left(-\frac{g}{l}\theta'\right)\Delta t$$

# Use RK2 to calculate the total energy of SHO

- We have seen previously that energy as calculated using Euler method is unstable.
- Now try to calculate  $E$  again, using the values of  $\omega_i$  and  $\theta_i$  as calculated using RK2.

$$E_{i+1} = \frac{1}{2} ml^2 \omega_{i+1}^2 + \frac{1}{2} mgl \theta_{i+1}^2$$

- You will have to do this in the HA3.
